Course Syllabus — 2026

Purpose and audience

This multi-page course syllabus explains a practical process for readers, authors, and reviewers. It combines several accessibility semantics in a document someone might author rather than concatenating atomic fixtures.

The guide includes a short bonjour language example and a descriptive external resource.resource page

Recommended actions

1. Review the source contract

- Export through the documented workflow
- Inspect destination evidence

Evidence summary

Property	Status	Owner
Headings	Declared	Author
Links	Descriptive	Editor
Tables	Header row	Reviewer

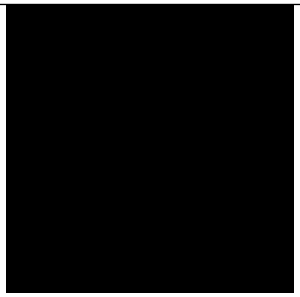

Figure 2. Course Syllabus overview.

A source-grounded evaluation preserves the declared property values as contracts and does not assign a global accessibility score.

Implementation notes

The second page records context, exceptions, and a short narrative so that the document exercises coexistence across paragraphs, lists, links, images, metadata, language, tables, and captions.

Exception handling

If a destination representation is ambiguous, the procedure abstains and records the reason. A parser failure is not treated as proof that source semantics were absent.

This statement carries a note marker .[1]
